

HW 8. DeFi EDA

- Conduct EDA for one of the top-50 DeFi protocols listed on DeFiLlama, using the data collection tools studied in the workshop:
 - [web3.py](#)
 - Etherscan
 - DeFiLlama
 - TheGraph
 - CoinGecko
 - Dune Analytics
- Use at least 5 of these tools to gather historical data about the chosen protocol's metrics, its token, and market performance.
- Construct relevant metrics and graphs for your chosen protocol, compare it with market competitors, and provide conclusions based on your analysis.
- Choose one of the following protocol types:
 - DEX (Sushiswap, Curve, Balancer)
 - Lending (Aave, Compound, Morpho)
 - Derivatives (Hyperliquid, Pendle)
 - Staking (Lido, Solv, Eigen)
 - Bridges (Stargate, Accross)
 - Aggregators (1inch, CowSwap)
 - RWA (BUIDL, Maple)
- For example, for a DEX platform, you could construct the following metrics:
 - TVL (Total Value Locked)
 - Trading volumes
 - Ranking of liquidity pools and assets
 - Token market capitalization
 - Trading volumes of top pools
 - Supported blockchains
- **Extra:** Set up public Dune dashboard for chosen protocol
- **LLMs can be used as an assistance tool for analysis and development but the full chat transcript must be provided for transparency and reproducibility**
